

Arc

User Guide

Trend Genius Campaign Management System

Internal Reference — Strategists and Sales

About this guide

This document covers Arc in Admin mode. Editor mode looks similar but has fewer capabilities. If something described here isn't visible in your account, you likely have Editor or Read Only access.

Overview

What Is Trend Genius?

Trend Genius is an X advertising solution that automatically activates and deactivates ads based on real-time conversation volume on the platform. When people start talking about a specific topic at a high enough rate, Trend Genius detects the spike and turns on the client's ads. When conversation dies down, it turns them off. This means the client's ads only run during relevant cultural moments, maximizing engagement and minimizing wasted spend.

What Is Arc?

Arc is the self-serve CMS (content management system) for Trend Genius. It's built and maintained by ICG, our vendor partner. Arc is where campaigns are configured, monitored, and managed after ICG handles the initial technical setup and the client sets up their campaign in ads manager.

In Arc you can:

- Monitor campaign performance (spend, impressions, engagement, CTR)
- View trigger activity and see when ads are firing in real time
- Import and manage ad creatives from X Ads Manager
- Configure notification emails so stakeholders get alerts when triggers fire
- Manage team access and roles
- Review an audit trail of all changes made to the campaign

Who Does What?

Role	Responsibilities in Arc
ICG	Builds the campaign shell in Arc, handles pricing and workback schedules. They are the technical backbone.
Strategist	Admin access. Creates and calibrates triggers, writes queries, manages day-to-day campaign operations: team setup, trigger monitoring, and submits Zendesk tickets to kick off new campaigns. Primary owner of the campaign in Arc.
Sales	Read Only access (or Editor if needed). Checks campaign performance for client conversations, client communication, trigger monitoring, and screenshots dashboards for recaps.
Client / Agency	Editor access. Can view campaign performance and trigger activity. Should not have Admin access to avoid accidental changes to live campaigns.

Getting Started

This section walks through the end-to-end process of going from a sold campaign to a live, managed Trend Genius deployment in Arc.

1. Submit a Zendesk Ticket to ICG

This is always the first step. ICG needs a ticket to begin building the campaign.

- Go to qvwrsupport.zendesk.com
- Click **Submit a Ticket**, then select **Standard Request**
- In the **Program Type** dropdown, select **Trend Genius**
- In the description, specify:
 - How many triggers you need
 - What type each trigger is (conversation or sports)
 - What each trigger should be named
 - Campaign start and end dates
 - Handle and ads ID

Example ticket:

"We need 1 convo trigger named Taylor, 1 convo trigger named Swift, and 1 sports trigger named NBA where we are looking at NBA overtime. Campaign start date is XX and campaign end date is XX. The handle will be @handle and the ads id is XXXXXXXX "

New trigger types: If you need a sports trigger that doesn't currently exist in Arc, use the same process but call out that it's a new trigger. ICG will handle the rest.

ICG will respond on the Zendesk with pricing and a workback schedule. **SLA is 3 business days.**

2. Create a Slack Channel

While the Zendesk is being processed, create a Slack channel for campaign communication. Follow the process in the [Slack channel setup doc](#).

Add the following people to the channel:

- marie.solano@icgroupinc.com
- Dean.Gula@icgroupinc.com
- eric.stewart@icgroupinc.com
- The assigned sales rep and strategist

3. Account Creation

Once ICG processes the ticket and creates a team in Arc, everyone added to the team will receive an email invitation. Click the link in the email to create an account (or log in if you already have one). After logging in, you'll land on the campaign's Team tab.

Platform Reference

Arc has four main navigation tabs at the top of the screen: Trend Genius, Team, Teams Admin, and Users Admin. Within a campaign, there are four sub-tabs: General, Ads, Triggers, and Audit Logs. This section covers each one.

Team Tab

The Team tab is where you manage who has access to the campaign and verify the connected ads account.

Team tab — user management and connected ads accounts

Users

This section lists everyone on the team. Click **Add User** to invite someone by entering their name and email. Each user is assigned a role that controls what they can see and do:

Role	Access Level	Assign To
------	--------------	-----------

Admin	Full access — all tabs, all features, including audit logs, notification emails, backfill analytics, and team management	Strategists and internal campaign owners
Editor	Can view and modify campaign settings, ads, and triggers. Cannot access audit logs or team management.	Client contacts and agency partners
Read Only	View-only access to all visible tabs. Cannot make any changes.	Sales team members and stakeholders who need visibility but shouldn't be making edits

Best practice:

Be deliberate about role assignment. An accidental threshold change or trigger pause on a live campaign can cause ads to misfire and burn budget. When in doubt, default to Read Only.

Ads Accounts

At the bottom of the Team tab, verify that the correct X Ads Account is listed and shows a **Ready** status. This is the ads account Arc uses to control ad delivery. If the account is missing or not showing Ready, escalate immediately in the Slack channel with ICG — the campaign cannot function without it.

Trend Genius Tab (Campaign List)

The Trend Genius tab in the top navigation shows all Trend Genius campaigns associated with your team.

Campaign List Fields

Field	Description
Trend Genius Campaign Name	The campaign name assigned by ICG during setup
X Account	The X handle the campaign posts from
X Ads Account ID	The ads account ID linked to the campaign
Start Date / End Date	The campaign flight window
Status	Current status: Live, Paused, or Completed

Use the **Search** bar to filter by campaign name or X account. Use the **Status** dropdown to filter by status. Click into any campaign to open its detail view.

Campaign Detail: General Tab

The General tab is the default view when you open a campaign. It serves as the campaign's performance dashboard.

Campaign Schedule

The card at the top shows whether the campaign is **Live** or Paused, along with the start and end dates (displayed in EST). Admins can click **Edit Dates** to adjust the flight window. To launch a campaign – once everything is set up you must hit the **Schedule Campaign** button.

Campaign Performance Metrics

The metrics section provides an aggregate view of campaign performance across all triggers:

Metric	What It Measures
Total Runtime	Cumulative time the campaign has been active (hours and minutes)
Total Spend	Total ad spend across all triggers to date
Cost Per Result	Average cost per engagement. Lower is more efficient.
Impressions	Total number of times ads were served to users' timelines
Engagements	Total interactions — likes, retweets, replies, clicks, follows, etc.
Engagement Rate	$\text{Engagements} \div \text{Impressions}$.
Clicks	Total clicks on the ad creative or destination URL
CTR	Click-through rate: $\text{Clicks} \div \text{Impressions}$

Trigger Performance Table

Below the aggregate metrics, the Trigger Performance table breaks results down by individual trigger. Each row shows one trigger's name, spend, cost per result, impressions, engagements, engagement rate, CTR, how many times the trigger fired ("Times On"), total duration the trigger was active, and its current status.

Click the expand arrow on any trigger row to see performance broken down further by individual ad creative. This is useful for identifying which creatives are driving the most engagement within a given moment.

Tip:

The trigger performance table is the best source for campaign recaps and client reporting. It shows exactly which moments drove results and how each creative performed within those moments.

Backfill Analytics

Clicking this button re-pulls all performance data from the X Ads API for the campaign. Use it if metrics look incomplete, delayed, or out of sync with what you see in X Ads Manager.

Notification Emails

This section controls who receives email alerts when a trigger fires and ads go live. These emails go out in real time.

- Click **Add Email** to add a recipient
- Use the pencil icon to edit an existing email
- Use the trash icon to remove a recipient

Make sure all relevant stakeholders are on this list — internal team members, client contacts, and agency partners who want real-time visibility into when the campaign activates.

Campaign Detail: Ads Tab

The Ads tab is where ad creatives from X Ads Manager are imported into Arc and linked to automation triggers.

How It Works

Ads are created and managed in X Ads Manager. Arc doesn't replace X Ads Manager — it connects to it. You import your campaign structure into Arc so that triggers can automatically turn ads on and off. The workflow is:

- Build and schedule your campaign in X Ads Manager (typically handled client's agency)
- In Arc, click **Import X Ads Campaign** (top right) to pull the campaign structure in
- If ads are updated in X Ads Manager later, click **Refresh Campaigns** to sync changes

Campaign Structure

Imported campaigns are organized in a three-level hierarchy that mirrors ads manager

- **Campaign** — The top-level container. Shown with its campaign ID and an overall Paused/Running status.
- **Ad Group** — A grouping within the campaign, usually corresponding to one trigger. Each ad group has its own Running toggle and an **Add New Creative** button.
- **Individual Ads** — The actual creatives. Each ad displays a preview thumbnail, the post copy, ad status (Active/Paused), and its automation trigger assignment.

Trigger Assignments

Each ad that is to be turned on and off via the trend genius logic needs to be linked to a trigger. When the trigger fires, all ads assigned to it are automatically activated. The right side of each ad row shows:

- **Automation Trigger** — Which trigger controls this ad
- **Status** — Whether the trigger is Active or Inactive

Use **Add Trigger** to assign a trigger to an ad, or **Remove Trigger** to unlink one. If an ad shows "No trigger assigned," it will not activate automatically — it's effectively disconnected from the Trend Genius system. Therefore, if an ad is active and does not have a trigger assigned, it will always be on and if the ad is paused and does not have a trigger assigned it will always be inactive.

Add New Creative

To add a new creative after the trend genius campaign has already launched. The client/agency should create a new post via the composer in ads manager. Then grab that post id and use the **Add New Creative** button to pull that post into the corresponding ad group. The post will not be pulled into the ad group or campaign until the assigned trigger turns on – this is so that there is no accidental spend / need to pause the campaign to turn the post off.

Filtering

Use the dropdown filters at the top of the Ads tab (**All Statuses, All Triggers**) to narrow the view. This is especially useful on campaigns with many ad groups and creatives.

Campaign Detail: Triggers Tab

The Triggers tab is the core of Trend Genius. This is where the automation logic lives — the rules that determine when ads turn on and off based on real-time conversation on X.

How Triggers Work

Each trigger monitors conversation volume on X in real time using a predefined query. When the volume of matching posts crosses above a set threshold (the ON threshold), the trigger fires and

activates its associated ads. When volume drops below a lower threshold (the OFF threshold), ads are deactivated. This cycle happens automatically — no manual intervention required.

Trigger Card Anatomy

Each trigger is displayed as a card with the following sections:

Type

The label below the trigger name (e.g., "Conversation") indicates what type of trigger it is. Trigger types are defined by ICG during setup.

ON Threshold / OFF Threshold

These numbers represent posts-per-hour thresholds:

- **ON Threshold** — When conversation volume reaches this level for over 2 consecutive hours, the trigger fires and ads turn on.
- **OFF Threshold** — When volume drops to this level over 2 consecutive hours, ads turn off.

Strategists calibrates these values during setup based on an [analysis](#). Changing them without understanding their calibration can cause triggers to fire too aggressively (wasting budget) or not fire at all (missing moments).

Important:

Do not adjust thresholds without consulting with the strategist.

Query

The query is the search logic that defines what conversation the trigger listens for. Queries are composed of keyword terms using boolean operators (OR, AND).

Queries are to be defined by the strategy surrounding the campaign and be supported by the creative the client has.

Posts Per Hour Chart

A real-time chart showing conversation volume (posts per hour) over a rolling 24-hour window. Two horizontal lines mark the ON and OFF thresholds. When the bars cross above the ON line, the trigger is firing. This chart is a useful visual for demonstrating to clients when their campaign activated during a moment.

Associated Ads

The table on the right side of each trigger card shows all ads linked to that trigger. Columns include:

- **Ad Name** — The ad creative identifier

- **Activation** — Whether the ad has been triggered before (shows "Triggered" or blank)
- **Ad Status** — Current status (Running or Paused)
- **Ad ID** — Clickable link to the ad in X
- **Line Item** — The ad group the ad belongs to

Trigger Actions

Each trigger card has action buttons:

- **Inactive / Threshold not met / Threshold met**— Current status of the trigger
- **Deactivate / Activate** — Whether the trigger is actively monitoring conversation. When it says Activate, the trigger will not fire regardless of conversation volume and clicking fully deactivates the trigger
- **Edit** — Opens the trigger for editing (thresholds, query, etc.)
- **Delete** — Permanently removes the trigger
- **Manage** — Manage which ads are associated with the trigger

Campaign Detail: Audit Logs Tab (Admin Only)

The Audit Logs tab provides a complete, time-stamped record of every action taken within a campaign. It is only visible to users with the Admin role.

What Gets Logged

Every create, update, and delete action in the campaign is recorded:

- Trigger changes (threshold updates, query edits, pausing/activating)
- Adding or removing notification email recipients
- Importing or adding ad creatives
- Campaign schedule changes
- Team member additions or role changes

Log Entry Fields

Field	Description
Action	The type of operation: Create, Update, or Delete
Description	A summary of what changed (e.g., "Updated trigger 'NBA Upsets'")
User	The name and email of the person who made the change
IP Address	The IP address the change was made from

Date	Timestamp of the action
Resource	The type and ID of the affected object

Filtering

Use the filter controls at the top to narrow results by **Action Type**, **User**, and/or a **Start Date / End Date** range. Click **Clear Filters** to reset.

Audit logs are most useful for troubleshooting (“why did this trigger get paused?”) and for accountability (“who made this change and when?”).

Common Tasks: Quick Reference

A quick lookup for the most common things you’ll need to do in Arc.

Task	Where to Go	Steps
Kick off a new campaign	Zendesk	Submit a Standard Request ticket with Program Type = Trend Genius. Include trigger count, types, and names.
Check campaign performance	Trend Genius → Campaign → General	Review the Campaign Performance metrics and Trigger Performance table.
See if triggers are firing	Trend Genius → Campaign → Triggers	Look at the Posts Per Hour charts. If bars are above the ON line, the trigger is active.
Add someone to the team	Team → Add User	Enter their name, email, and select the appropriate role (Admin, Editor, or Read Only).
Add someone to trigger alerts	General → Notification Emails	Scroll to the bottom of the General tab and click Add Email.
Import ads from X Ads Manager	Ads → Import X Ads Campaign	Click the button in the top right. Ads will be pulled in and organized by campaign/ad group.
Sync updated ads	Ads → Refresh Campaigns	Click Refresh Campaigns to pull in any changes made in X Ads Manager.
Link an ad to a trigger	Ads tab	Find the ad and click Add Trigger. Select the trigger from the list.
Fix incomplete metrics	General → Backfill Analytics	Scroll to the bottom of the General tab and click Backfill Analytics.

Investigate a change	Audit Logs	Filter by user, action type, or date range to find the specific change.
Request a new trigger type	Zendesk	Submit a ticket using the same process as Step 1. Call out that it's a new trigger type.
Escalate an issue	Slack channel	Post in the campaign Slack channel. ICG monitors these for urgent issues.

Role Permissions Matrix

A complete breakdown of what each role can and cannot do in Arc.

Capability	Admin	Editor	Read Only
View campaign performance	✓	✓	✓
View trigger activity and charts	✓	✓	✓
View associated ads	✓	✓	✓
Edit trigger thresholds	✓	—	—
Import / refresh ads	✓	✓	—
Add / remove trigger assignments	✓	✓	—
Add new creatives	✓	✓	—
Manage notification emails	✓	✓	—
Backfill analytics	✓	—	—
View audit logs	✓	—	—
Add / remove team members	✓	✓	—
Edit campaign dates	✓	✓	—

Support & Escalation

Situation	Action
New campaign setup, new trigger types, pricing questions	Submit a Zendesk ticket at qwvrsupport.zendesk.com . SLA: 3 business days.
Urgent issue on a live campaign	Post in the campaign's Slack channel. ICG monitors these.
Ads account not showing Ready, campaign not functioning	Escalate immediately in Slack. Tag ICG contacts directly.
Questions about Arc access, roles, or this guide	Ask your strategist or campaign owner.
