

Post Lens - Grok Imagine

Product Proposal: Post Lens xAI campaigns:

Proposed min brand Investment: \$500K

<https://post-lens.onrender.com/> ([see demo](#))

Overview:

Post Lens is a web app tool that lets brands reply **Manually** to X users with custom rendered videos. A community manager pastes a user's selected post URL into the tool, picks a creative template, previews the still composition, approves it, and downloads a finished 720p MP4 ready to be posted as an organic reply.

The pipeline runs in under three minutes per video, a one-week-with-an-agency turnaround compressed into the time it takes to write a thoughtful reply. Brands can engage in real-time cultural moments with the production quality previously reserved for hero campaign assets.

Built on the X API v2 (post lookup) and xAI Grok Imagine (image-to-image still preview, then image-to-video animation). The two-step preview then approves flow keeps a human in the loop on creative direction and posting.

Value:

- Brands:
 - Real-time creative reply at scale: Three minutes per video versus three days with an agency. Brands can engage with cultural moments while they're still cultural moments.
 - Engagement multiplier: Custom video replies on X usually have more engagement than plain-text replies.
 - Low marginal cost: ~\$0.50 in API spend per published video; the largest line item is community manager time, not production. (we have no cost using our own API, the cost will be reflected in brand wants to implement by itself, then they will need to subscribe to xAI API and X API, which means a win for us too)
 - Reusable creative templates: One-time prompt engineering produces a template that can be reused across hundreds of replies and ported between campaigns.
 - Brand-safe by design: a social media manager approves the posts, every image before the video render, and posts every reply manually. The tool never autonomously publishes.
- Users:
 - Users become the center: Their post is the protagonist.
 - More Engagement on their original post: The brand CTA requesting the users to send them posts "to Dracarys, or BBQ" and replies with the new video are fun and attractive to more users.
 - Personal recognition from a brand: A personalized moment that feels like the brand actually saw them.

- No personal data captured: The tool reads only their public post text and the public author handle.
- X or xAI:
 - Drives reply volume and watch time on X.
 - Showcases Grok Imagine to brand creative teams: Every successful campaign is a live sales demo for xAI's video model with the agencies and brands most likely to license it at scale.
 - Positions X as the platform where brands actually engage
 - A format that respects the organic-first culture + promoted posts: The replies with video are received as gifts inside conversations the user opted into.

User Experience:

1. The user sees the brand's CTA tweet. A CTA opt-in: "Drop your hottest take below with Dracarys! and our dragon will turn it to ash."
2. The user replies with their take and the topic. Public consent to remix is implicit in the Keyword use.
3. Brand's reply lands within 10–60 minutes if the social media manager is active. A custom MP4 quote replying to the user's original post, featuring their text on screen.
4. The user reposts or quotes the reply, they're the star, and the asset is shareable.

Creative Strategists Experience:

Types of campaigns they can sell:

- Reactive cultural moments: Awards shows, sports finals, premiere weeks, viral memes, the campaign rides a moment that's already happening.
- M&E integrations. A creature, character, or world from owned M&E (House of the Dragon dragons, King of the Hill BBQ, Mortal Kombat, Sponge Bob).
- Product launches with mascots: A brand mascot, animated or photoreal, interacts with user posts about the product.
- Seasonal /holidays: Halloween, Valentine's, Christmas postcards?
- Always-on community engagement: A single template the whole year so the brand can fire off a video reply whenever a relevant user post surfaces.

Technical Implementation:

Build on options:

In house requirements:

- Lightweight hosting no DB, (Render, Vercel, or similar: ~\$10/month for the starter tier)
- TPM tool upkeep and prompting.
- Legal Review on how to share with brands so they can operate this by themselves and not with a cam.

Pros:

- Full control over templates, prompts, and brand guardrails
- Same-day creative iteration; no agency back-and-forth
- Templates and prompts stay internal

Cons:

- Up-front TPM effort (8-16h) depending on the template

Brand builds by itself: Brand's engineering team forks the codebase TPMs maintain, deploys to their own infra. Brand holds and pays for both the X API key and xAI API key directly. xAI/X just provides the prototype + docs; brand owns operations end-to-end.

What matters for this option to the brand: lowest marginal cost (~\$0.50/video, raw API), full IP/data control, direct billing relationship with X and xAI APIs (easier to negotiate volume discounts later).

System Architecture:

Basic Flow:

User opens Post Lens portal

↓

Pastes X post URL

↓

Backend → X API v2 → tweet data

↓

Social Media manager picks creative template

↓

Backend renders tweet card (satori → PNG)

↓

Backend → Grok Imagine /images/edits → still preview URL

↓

Social Media Manager previews → Regenerate or Approve

↓

Backend → Grok Imagine /videos/generations → request_id

↓

Backend polls /videos/:id every 5s until status=done

↓

Social Media manager downloads MP4 → posts reply on X

Core Components:

Just a simple web app in Node js calling the APIs and generating the video in the app.

Web server Single Node + Express service

X API client Authenticated v2 lookups by post ID fetch + Bearer token

xAI Imagine client

Frontend Single-file vanilla JS portal

Basic APIs Integrations call:

None

X API v2 (post lookup):

GET <https://api.x.com/2/tweets/{id}>
?expansions=author_id
&user.fields=name,username,profile_image_url

&tweet.fields=created_at,public_metrics

None

Grok Imagine — still preview (image-to-image):

POST <https://api.x.ai/v1/images/edits>
{
 "model": "grok-image-image",
 "prompt": "<template prompt with name/handle/text interpolated>",
 "image": { "url": "data:image/png;base64,..." },
 "aspect_ratio": "16:9",
 "resolution": "2k",
 "response_format": "url"
}

→ { "data": [{ "url": "<temporary still URL>" }] }

None

Grok Imagine — video generation (image-to-video):

POST <https://api.x.ai/v1/videos/generations>
{

```
"model": "grok-imagine-video",
"prompt": "<animation prompt>",
"image": { "url": "<approved still URL>" },
"duration": 8,
"aspect_ratio": "16:9",
"resolution": "720p"
}
```

→ { "request_id": "..." }

None

Grok Imagine — status polling:

GET https://api.x.ai/v1/videos/{request_id}

→ { "status": "pending" | "done" | "failed" | "expired",

"video": { "url": "<temporary MP4 URL>", "duration": 8 } }
